PIPERIDINE DERIVATIVES USEFUL AS CCR5 ANTAGONISTS

BACKGROUND

The present invention relates to piperidine derivatives useful as selective CCR5 antagonists, pharmaceutical compositions containing the compounds, and methods of treatment using the compounds. The invention also relates to the use of a combination of a CCR5 antagonist of this invention and one or more antiviral or other agents useful in the treatment of Human Immunodeficiency Virus (HIV). The invention further relates to the use of a CCR-5 antagonist of this invention, alone or in combination with another agent, in the treatment of solid organ transplant rejection, graft v. host disease, arthritis, rheumatoid arthritis, inflammatory bowel disease, atopic dermatitis, psoriasis, asthma, allergies or multiple sclerosis.

The global health crisis caused by HIV, the causative agent of Acquired Immunodeficiency Syndrome (AIDS), is unquestioned, and while recent advances in drug therapies have been successful in slowing the progression of AIDS, there is still a need to find a safer, more efficient, less expensive way to control the virus.

It has been reported that the CCR5 gene plays a role in resistance to HIV infection. HIV infection begins by attachment of the virus to a target cell membrane through interaction with the cellular receptor CD4 and a secondary chemokine co-receptor molecule, and proceeds by replication and dissemination of infected cells through the blood and other tissue. There are various chemokine receptors, but for macrophage-tropic HIV, believed to be the key pathogenic strain that replicates *in vivo* in the early stages of infection, the principal chemokine receptor required for the entry of HIV into the cell is CCR5. Therefore, interfering with the interaction between the viral receptor CCR5 and HIV can block HIV entry into the cell. The present invention relates to small molecules which are CCR5 antagonists.

CCR-5 receptors have been reported to mediate cell transfer in inflammatory diseases such as arthritis, rheumatoid arthritis, atopic dermatitis, psoriasis, asthma and allergies, and inhibitors of such receptors are expected to be useful in the treatment of such diseases, and in the treatment of other inflammatory diseases or conditions such as inflammatory bowel disease, multiple sclerosis, solid organ transplant rejection and graft v. host disease.

Related piperidine derivatives which are muscarinic antagonists useful in the treatment of cognitive disorders such as Alzheimer's disease are disclosed in US patents 5,883,096; 6,037,352; 5,889,006; 5,952,349; and 5,977,138.

A-M. Vandamme et al., Antiviral Chemistry & Chemotherapy, 9:187-203 (1998) disclose current clinical treatments of HIV-1 infections in man including at least triple drug combinations or so-called Highly Active Antiretroviral Therapy ("HAART"); HAART involves various combinations of nucleoside reverse transcriptase inhibitors ("NRTI"), non-nucleoside reverse transcriptase inhibitors ("NNRTI") and HIV protease inhibitors ("PI"). In compliant drug-naive patients, HAART is effective in reducing mortality and progression of HIV-1 to AIDS. However, these multidrug therapies do not eliminate HIV-1 and long-term treatment usually results in multidrug resistance. Development of new drug therapies to provide better HIV-1 treatment remains a priority.

SUMMARY OF THE INVENTION

DETAILED DESCRIPTION OF THE INVENTION

As used herein, the following terms are used as defined below unless otherwise indicated.

Alkyl (including the alkyl portions of alkoxy, alkylamino and dialkylamino) represents straight and branched carbon chains and contains from one to six carbon atoms.

Alkenyl represents C_2-C_6 carbon chains having one or two unsaturated bonds, provided that two unsaturated bonds are not adjacent to each other.

Substituted phenyl means that the phenyl group can be substituted at any available position on the phenyl ring.

Acyl means a radical of a carboxylic acid having the formula alkyl-C(O)-, aryl-C(O)-, aralkyl-C(O)-, (C_3-C_7)cycloalkyl-C(O)-, (C_3-C_7)cycloalkyl-(C_1-C_6)alkyl-C(O)-, and heteroaryl-C(O)-, wherein alkyl and heteroaryl are as defined herein; aryl is R^{12}-phenyl or R^{12}-naphthyl; and aralkyl is aryl-(C_1-C_6)alkyl, wherein aryl is as defined above.

Heteroaryl represents cyclic aromatic groups of 5 or 6 atoms or bicyclic groups of 11 to 12 atoms having 1or 2 heteroatoms independently selected from O, S or N, said heteroatom(s) interrupting a carbocyclic ring structure and having a sufficient number of delocalized pi electrons to provide aromatic character, provided that the rings do not contain adjacent oxygen and/or sulfur atoms. For 6-membered heteroaryl rings, carbon atoms can be substituted by R^7, R^8 or R^9 groups. Nitrogen atoms can form an N-oxide. All regioisomers are contemplated, e.g., 2-pyridyl, 3-

pyridyl and 4-pyridyl. Typical 6-membered heteroaryl groups are pyridyl, pyrimidinyl, pyrazinyl, pyridazinyl and the N-oxides thereof. For 5-membered heteroaryl rings, carbon atoms can be substituted by R^{10} or R^{11} groups. Typical 5-membered heteroaryl rings are furyl, thienyl, pyrrolyl, thiazolyl, isothiazolyl, imidazolyl, pyrazolyl and isoxazolyl. 5-Membered rings having one heteroatom can be joined through the 2- or 3- position; 5-membered rings having two heteroatoms are preferably joined through the 4-position. Bicyclic groups typically are benzo-fused ring systems derived from the heteroaryl groups named above, e.g. quinolyl, phthalazinyl, quinazolinyl, benzofuranyl, benzothienyl and indolyl.

Preferred points of substitution for 6-membered heteroaryl rings at R^2 are described above. When R^2 is a 5-membered heteroaryl group, the R^{10} and R^{11} substituents are preferably attached to carbon ring members adjacent to the carbon joining the ring to the rest of the molecule, and R^{11} is preferably alkyl; however, if a heteroatom is adjacent to the carbon joining the ring to the rest of the molecule (i.e., as in 2-pyrrolyl), R^{10} is preferably attached to a carbon ring member adjacent to the carbon joining the ring to the rest of the molecule.

Halogen represents fluoro, chloro, bromo and iodo.

solid organ transplant rejection and graft v. host disease: immune suppressants such as cyclosporine and Interleukin-10 (IL-10), tacrolimus, antilymphocyte globulin, OKT-3 antibody, and steroids;

inflammatory bowel disease: IL-10 (see US 5,368,854), steroids and azulfidine;

rheumatoid arthritis: methotrexate, azathioprine, cyclophosphamide, steroids and mycophenolate mofetil;

Certain CCR5 antagonist compounds of the invention may exist in different isomeric (e.g., enantiomers, diastereoisomers and atropisomers) forms. The invention contemplates all such isomers both in pure form and in admixture, including racemic mixtures.

Certain compounds will be acidic in nature, e.g. those compounds which possess a carboxyl or phenolic hydroxyl group. These compounds may form pharmaceutically acceptable salts. Examples of such salts may include sodium, potassium, calcium, aluminum, gold and silver salts. Also contemplated are salts formed with pharmaceutically acceptable amines such as ammonia, alkyl amines, hydroxyalkylamines, N-methylglucamine and the like.

Certain basic compounds also form pharmaceutically acceptable salts, e.g., acid addition salts. For example, the pyrido-nitrogen atoms may form salts with strong acid, while compounds having basic substituents such as amino groups also form salts with weaker acids. Examples of suitable acids for salt formation are hydrochloric, sulfuric, phosphoric,

acetic, citric, oxalic, malonic, salicylic, malic, fumaric, succinic, ascorbic, maleic, methanesulfonic and other mineral and carboxylic acids well known to those in the art. The salts are prepared by contacting the free base form with a sufficient amount of the desired acid to produce a salt in the conventional manner. The free base forms may be regenerated by treating the salt with a suitable dilute aqueous base solution such as dilute aqueous NaOH, potassium carbonate, ammonia and sodium bicarbonate. The free base forms differ from their respective salt forms somewhat in certain physical properties, such as solubility in polar solvents, but the acid and base salts are otherwise equivalent to their respective free base forms for purposes of the invention.

All such acid and base salts are intended to be pharmaceutically acceptable salts within the scope of the invention and all acid and base salts are considered equivalent to the free forms of the corresponding compounds for purposes of the invention.

Compounds of the invention can be made by the procedures known in the art, for example by the procedures described in the following reaction schemes, by the methods described in the examples below, and by using the methods described in US patents 5,883,096; 6,037,352; 5,889,006; 5,952,349; and 5,977,138.

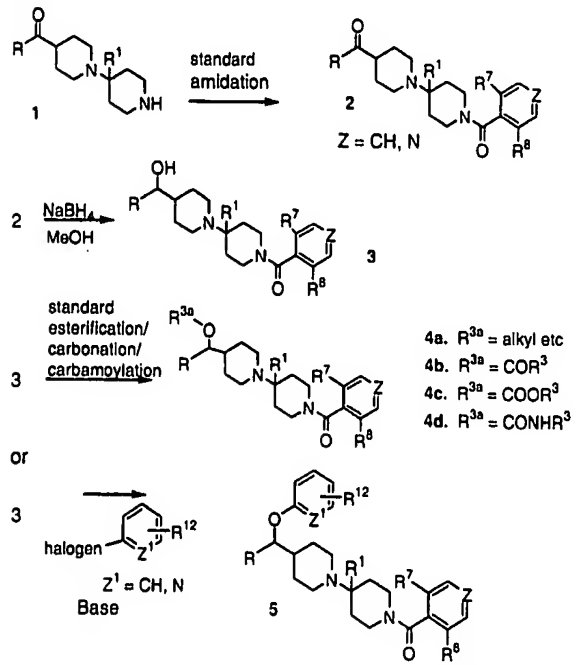
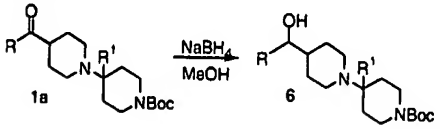
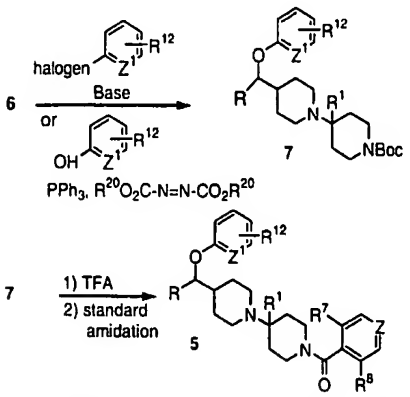
Scheme 1



Compounds of formula **3**, wherein R, R^7 and R^8 are as defined for formula I, Z is CH or N, and R^1 is an alkyl group such as methyl were prepared as depicted in Scheme 1. Ketone **1**, the synthesis of which was described in WO98/05292, was subjected to standard amidation with ArCOOH, EDCI or DEC, and HOBT, or ArCOCl, wherein Ar is R^7, R^8-substituted phenyl or pyridyl, followed by reduction with $NaBH_4$ to obtain **3**. Derivatization of the free hydroxyl moiety with alkyl halides, acyl chlorides (R^3COCl), alkyl chloroformates ($ClCOOR^3$) and isocyanides ($O=C=NR^3$) afforded ethers **4a**, esters **4b**, carbonates **4c**, and carbamates **4d**, respectively, wherein R^3 is a lower alkyl group. The aryloxy compounds, **5**, were obtained after condensation of the hydroxyl **3** with phenyl or pyridyl halides in the presence of a base.

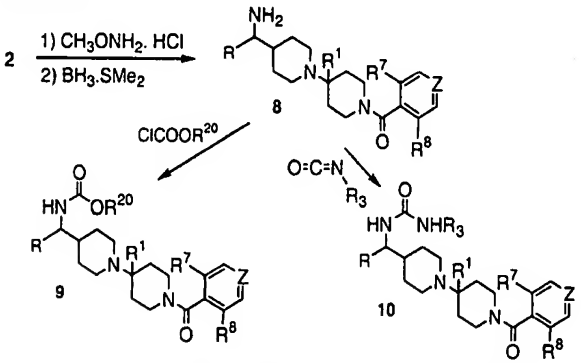
Scheme 2





Alternatively, compounds of formula **5** can be prepared by reduction of the N-Boc ketone **1a** to the alcohol **6** first, followed by functionalization of the free hydroxyl group with a halogen-substituted aryl in the presence of a base as shown in Scheme 2, or by a hydroxy-substituted aryl or heteroaryl (wherein Z^1 is as defined in Scheme 1) in the presence of PPh_3 and an azodicarboxylate of the formula $R^{19}O_2C\text{-}N{=}N\text{-}CO_2R^{20}$, wherein R^{20} is C_1-C_6 lower alkyl. Removal of the Boc protecting group and conversion to the amide is performed as in Scheme 1. This route allows the introduction of various aryloxy and heteroaryloxy moieties at R^3 through the use of nucleophilic displacement or Mitsunobu-type reaction on intermediate **6**.

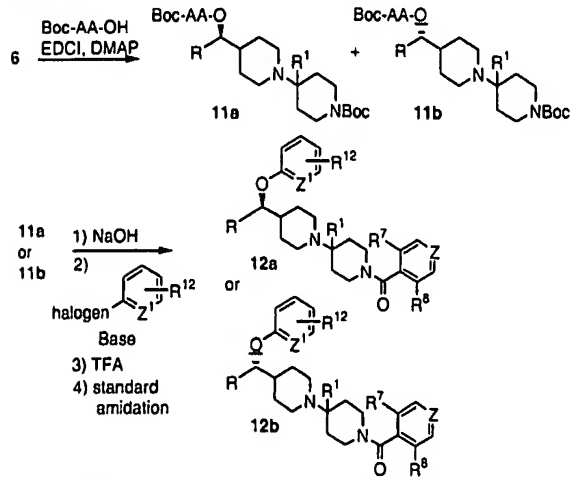
Scheme 3



Compounds of formula **8**, wherein R, R^1, R^7, R^8 and Z are as described in Scheme 1, were prepared by conversion of the ketone **2** to an oxime group with $CH_3ONH_2{\cdot}HCl$, and reduction with $BH_3{\cdot}S(CH_3)_2$ to

provide amine **8**. Derivatization of the free amine moiety with an alkyl chloroformate ($ClCOOR^{20}$, wherein R^{20} is C_1-C_6 alkyl) or an isocyanide ($O=C=NR^3$) affords carbamate compounds **9** and urea compounds **10**, respectively.

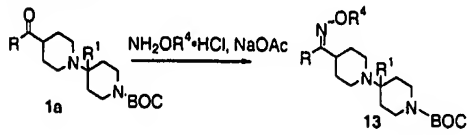
Scheme 4

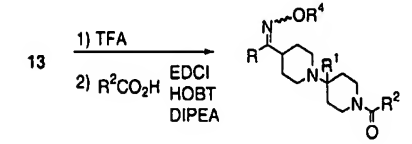


Preparation of chiral analogs was performed through chemical resolution. The alcohol **6** was coupled with a chiral Boc-protected amino acid to obtain diastereoisomers **11a** and **11b** which were separated by chromatography. The chiral auxialiary was then removed with NaOH for each diastereoisomer and the same sequence of reactions described in Scheme 2 was carried out on each individual enantiomer to obtain compounds **12a** and **12b**.

Oximes of formula I or II wherein X is $C=NOR^4$ are prepared from the corresponding ketones from any of several methods known to those skilled in the art.

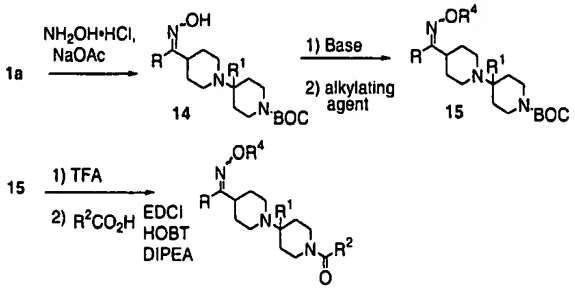
Scheme 5:





In Scheme 5, the ketone **1a**, wherein R and R^1 are as defined for formula I and II, is dissolved in a solvent such as CH_3OH or ethanol and treated with an R^4-substituted hydroxylamine such as O-methylhydroxylamine hydrochloride in the presence of a base such as sodium acetate. The resulting mixture of Z- and E-O-substituted oximes **13** can be separated or the mixture carried through and separated at the end. The BOC protecting group is removed by treatment with an acid such as aqueous HCl or trifluoroacetic acid, and the resulting amine is coupled to an acid under standard conditions to obtain a compound of formula I or II.

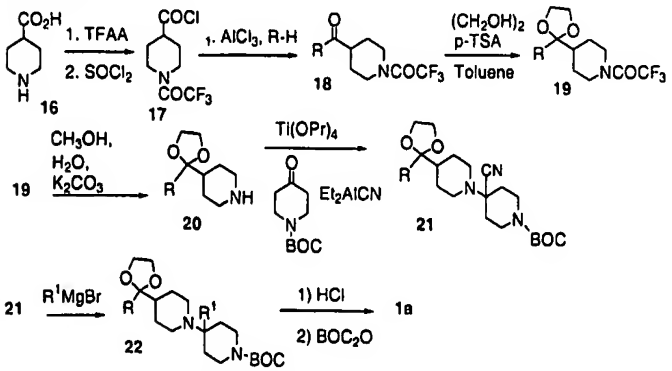
Scheme 6:



Alternatively, the ketone **1a** can be treated with $HONH_2$·HCl under similar conditions to yield, after separation, the E- and Z-oximes. Each oxime is then treated with a base such as potassium hexamethyldisilazide in a suitable solvent such as DMF followed by treatment with an alkylating agent, e.g., CH_3I, dimethylsulfate, CH_3CH_2I, trifluoroethyl triflate or similar electrophiles, to yield the desired O-substituted oxime.

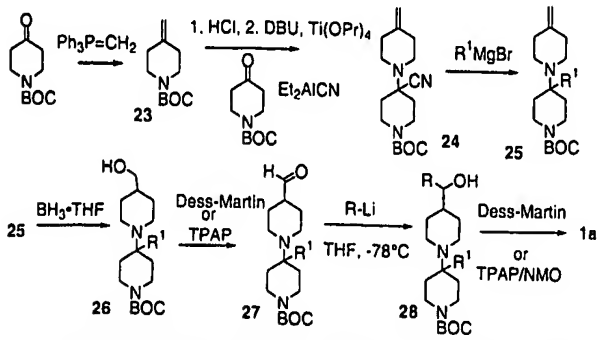
The ketone starting material of formula **1a** can be prepared by known methods as shown in Schemes 7 and 8.

Scheme 7:



In Scheme 7, Friedel-Crafts condensation of N-trifluoroacetyl-isonipecotoyl chloride **17** and an aromatic group R-H in the presence of a suitable catalyst such as $AlCl_3$ and optionally in a solvent such as CH_2Cl_2 yields a ketone **18** which is converted to its ethylene ketal **19** under standard conditions. The N-trifluoroacetyl group is removed and the resulting free amine **20** is treated with N-BOC-piperidine-4-one in the presence of a dehydrating agent such as titanium isopropoxide followed by treatment with diethylaluminum cyanide to give an aminonitrile **21**. The aminonitrile is treated with a grignard reagent (R^1Mg-halide) such as CH_3MgBr or vinylmagnesium bromide to give the alkylated product **22**. The ketal is removed by treatment with aqueous acid followed by re-protection under standard conditions using BOC anhydride to give **1a**.

Scheme 8:

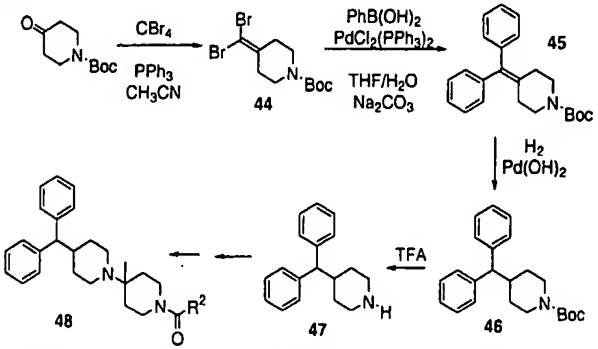


Alternatively, **23**, prepared via Wittig olefination of N-BOC-piperidone (Chen et al, Tetrahedron Lett., 37, 30 (1996), 5233-5234), is transformed to

intermediate **25** by analogy to the procedure described in Scheme 7. **25** is converted to alcohol **26** by hydroboration/oxidation. Alcohol **26** is treated with a suitable oxidant such as a mixture tetrapropylammonium perruthenate (TPAP) and N-methylmorpholine N-oxide (NMO) to give aldehyde **27**. The aldehyde is treated with an aryllithium reagent in a suitable solvent such as ether or THF and the resulting alcohol **28** is treated with an oxidizing agent such as Dess-Martin periodinane or TPAP/NMO to give the desired ketone.

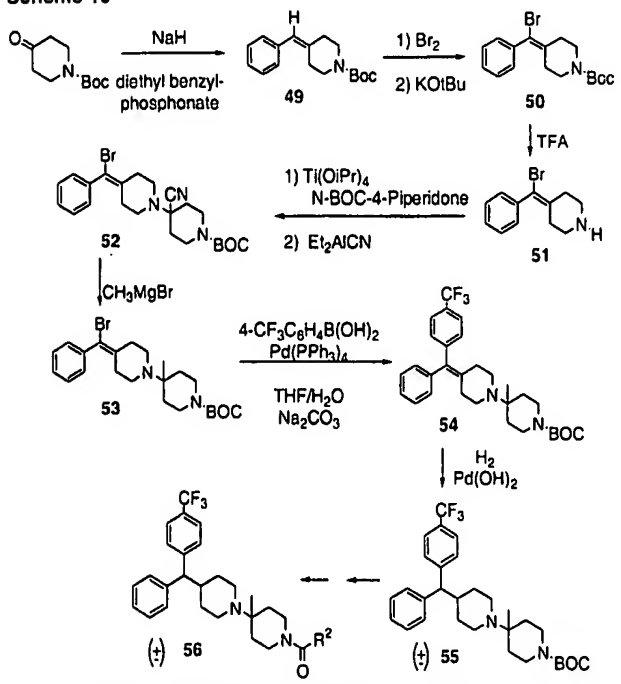
Compounds of formula I or II wherein X is $-C(R^{13})(R^{19})-$, wherein R and R^{19} are the same, or wherein R and R^{19} are different are prepared according to schemes 9 and 10, respectively. The schemes are exemplified by processes wherein R and R^{19} are each phenyl and wherein R is phenyl and R^{19} is CF_3-phenyl, respectively, but the general procedures apply to other R and R^{19} groups.

Scheme 9



N-BOC-4-piperidone is treated with CBr_4 to obtain the di-bromo compound of formula **44**, which is then treated with phenylboronic acid to obtain the BOC-protected diphenylmethylene-piperidine of formula **45**. The methylene bond is reduced using standard conditions to obtain the BOC-protected diphenylmethyl-piperidine of formula **46**, the BOC group is removed and the amine of formula **47** is treated as described for compounds **20-22** of Scheme 7, the BOC group is removed by treatment with **TFA**, and the resultant amine subjected to a standard amidation procedure, e.g., treatment with a reagent R^2COOH and coupling agents such as EDCI, HOBT and a base, to obtain the compounds of formula **48**.

Scheme 10



N-BOC-4-piperidone is treated with a reagent such as diethyl benzylphosphonate to obtain the phenylmethylene-piperidine of formula **49**, which is then brominated to obtain the bromophenylmethylene-piperidine of fomula **50**. The BOC protecting group is removed using standard conditions, e.g., treatment with TFA, to obtain amine **51**, and the amine **51** is treated as described for compounds **20-22** of Scheme 7 to obtain the aminonitrile **52**, then the protected amine **53**. The amine **53** is treated with a reagent such as 4-CF_3-phenylboronic acid to obtain compound **54** and the methylene bond is reduced using standard conditions to obtain racemic **55**. The BOC group is removed by treatment with TFA, and the resultant amine subjected to a standard amidation procedure, e.g., treatment with a reagent R^2COOH and coupling agents such as EDCI, HOBT and a base, to obtain the racemic compounds of formula **56**.

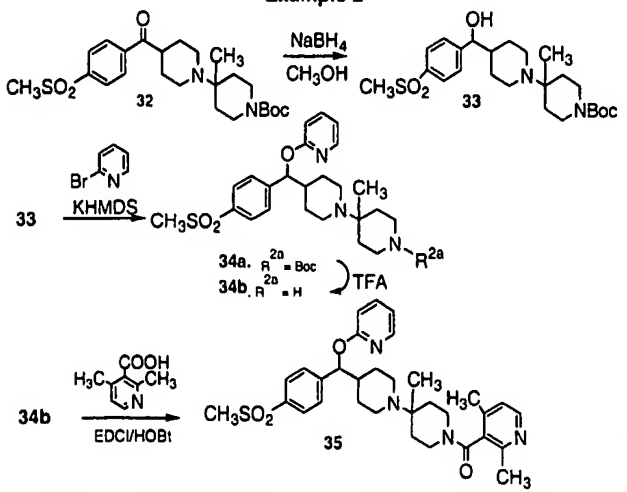
Example 2



A solution of ketone **32** (0.60 g, 1.29 mmol) and $NaBH_4$ (60 mg, 1.59 mmol) in CH_3OH (5 ml) was stirred overnight at RT. The reaction mixture was poured into 0.1 N NaOH, extracted with CH_2Cl_2, dried over Na_2SO_4, and concentrated to give **33** (0.60 g, 100%), as a white foam.

To a solution of alcohol **33** (543 mg, 1.2 mmol) in anhydrous toluene (4 ml) was added KHMDA, 0.5 N in toluene (2.6 ml, 1.30 mmol) followed, 15 min. later, by 2-bromopyridine (125 μl, 1.30 mmol). The reaction was heated 5 h at 60 °C, cooled to RT and poured into 5% aqueous $NaHCO_3$ (25 ml). Example 3

To a solution of ketone **30** (1.5 g, 3.22 mmol) in CH_3OH (50 ml) was added sodium acetate (5.0 g, 47 mmol) and *O*-Methyl hydroxylamine hydrochloride (3.26 g, 47 mmol), and the solution was stirred at RT for 24 h. The resulting mixture was then poured into aqueous NaOH and extracted with CH_2Cl_2. The combined extracts were dried, concentrated and chromatographed to yield 1.50 g (94%) of oxime **36**, as a mixture of E and Z isomers.

To a stirred solution of oxime **36** (0.200 g, 0.380 mmol) in THF (5 ml) was added BH_3•THF (1.0 M solution in THF) at 0 °C and the solution was then warmed to RT and stirred for 1 h. The reaction mixture was then cooled to 0°C and a solution of 1N KOH in CH_3OH (5 ml) was added. The reaction was warmed slowly to 60°C for 2 h, cooled to RT, quenched with water and extracted with CH_2Cl_2. Combined organic layers were concentrated and chromatographed over silica gel (eluting with 20% EtOH/EtOAc) to afford 0.100 g (50%) of amine **37**.

To a stirred solution of amine **37** (0.015 g, 0.030 mmol) was added pyridine (0.5 ml) and ClCOOCH$_3$ (0.25 ml), and the solution was stirred overnight. It was then poured into water, extracted with EtOAc, dried, concentrated and purified by preparative chromatography to give 0.010 g of desired product **38**: ^{1}H-NMR (300 MHz, $CDCl_3$) δ 7.45 (d, 2H), 7.05-7.12 (m, 3H), 6.95 (d, 2H), 4.95 (m, 1H), 4.45 (m, 1H), 4.15 (m, 1H), 3.62 (s,

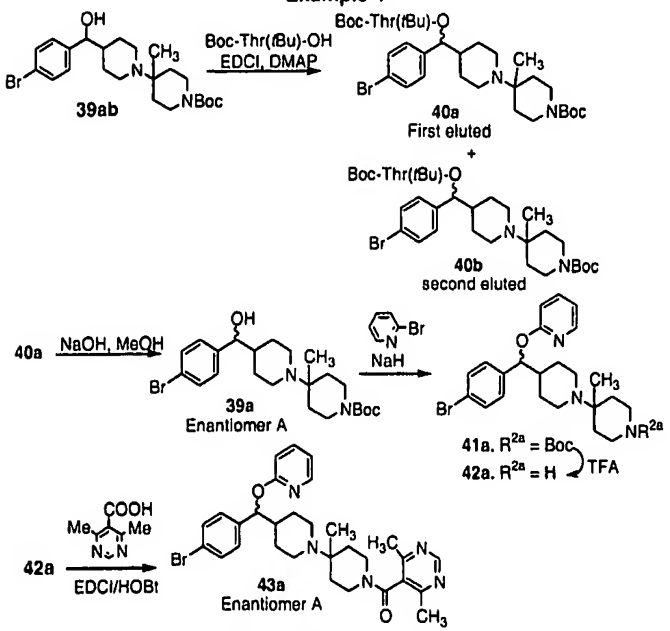
Example 4



A solution of alcohol **39ab** (660 mg, 1.41 mmol), Boc-Thr(*t*-Bu)-OH (413 mg, 1.50 mmol), DEC (290 mg, 1.50 mmol) and DMAP (190 mg, 1.55 mmol) in anhydrous CH_2Cl_2 (5 ml) was stirred overnight at RT. The reaction mixture was poured into aqueous saturated $NaHCO_3$, extracted with CH_2Cl_2, and dried over Na_2SO_4. The residue obtained after concentration of the solvent was subjected to flash chromatography over silica gel (eluting with CH_2Cl_2/acetone, 9:1) to afford, in order of elution: (i) first **40a** (391 mg, 38%), as a white foam; (ii) second **40b** (391 mg, 38%), as a white foam.

To a solution of diastereoisomer **40a** (391 mg, 0.54 mmol) in CH_3OH (3 ml) was added NaOH (110 mg, 2.75 mmol; 5 equiv.) and the solution was stirred at 65 °C for 3 h. The final mixture was then poured into aqueous 0.1 N NaOH and extracted with CH_2Cl_2 to yield **39a** (Enantiomer A) (246 mg, 98%) as a white foam. (Following the same procedure, **40b** gave **39b** (Enantiomer B). **40a** gives **43a** (Enantiomer A) and **40b** gives **43b** (Enantiomer B.)).

A solution of alcohol **39a** (210 mg, 0.45 mmol), NaH 60% in mineral oil (23 mg, 0.96 mmol), and 2-bromopyridine (60 μl; 0.62 mmol) in anhydrous DMF (1.5 ml) was stirred 2 h at 75 °C. 1) Trifluroacetic anhydride (TFAA) (300 ml) is added to isonipecotic acid (96 g) at 0°C and the reaction mixture is heated at reflux for 4h. Excess TFAA is removed under vacuo, the reaction mixture is taken up in EtOAc, washed with water and concentrated to give 160 g of the amide. 50 g of this amide is treated with $SOCl_2$ (300 ml) and the reaction mixture heated at reflux overnight. Excess thionyl chloride is then removed under vacuo to give 54 g of the acid chloride.

2) $AlCl_3$ (11g) is added slowly to a solution of the product of step 1 (10 g) in bromobenzene (40 ml) at ambient temperature and the reaction mixture is heated at reflux for 4 h. The organic layer is separated and washed with water, half saturated $NaHCO_3$ solution and concentrated to give 16.21 g of the desired ketone.

3) The product of step 2 (16.21 g) is dissolved in toluene (200 ml) containing ethylene glycol (25 ml) and p-toluenesulfonic acid (0.5 g). Example 6

A) Preparation of intermediate **27** (Scheme 8 (R^1 = CH_3)).

1) **23** (40.0 g, 0.203 mol) is vigorously stirred in EtOAc (200 ml) and concentrated aqueous HCl (80 ml) for 1.5 h. The solution is concentrated, diluted with Et_2O (300 ml) and H_2O (150 ml), the aqueous layer is separated and the organic layer is extracted once with H_2O (20 ml). Combined aqueous layers are concentrated and the residue is dried 24 h under high vaccum to provide 26.7 g (84%) of a white solid. To this hydrochloride and N-*tert*-butoxycarbonyl-4-piperidone (43.8 g, 0.22 mol) in anhydrous $ClCH_2CH_2Cl$ (80 mL) with 4 Å molecular sieves, are successively added DBU (33.2 ml, 0.22 mol) and titanium(IV) isopropoxide (65.5 ml, 0.22 mol) at 0° C, the reaction mixture is allowed to warm to RT and is stirred overnight at RT. The mixture is then cooled to 0 °C and diethylaluminum cyanide, 1 N in toluene (260 ml, 0.26 mol) is added with vigorous stirring. The reaction is allowed to warm to RT and stirred an additional 3 h, after which are added CH_2Cl_2 (300 ml), EtOAc (300 ml), and Celite (50 g). The reaction mixture is cooled to 0 °C, water (40 ml) is added slowly with vigorous stirring and, after an additional 5 min. stirring at RT, the excess of water is quenched with Na_2SO_4. The final mixture is then

filtered over Celite, evaporated and subjected to flash chromatography over silica gel (eluting with Hexanes/EtOAc, 8:2), to provide 50.3 g (83%) of **24** as a colorless oil which solidifies upon standing.

2) To a solution of **24** (27.7 g, 90.6 mmol) in anhydrous THF (200 mL) at 0 °C is slowly added CH_3MgBr 3 M in Et_2O (91 ml, 3 equiv.) with vigorous stirring. After the addition, the reaction is allowed to warm to RT and stirred 3 h. The reaction is then poured into aqueous saturated NH_4Cl, extracted with Et_2O (4 times), washed with brine, dried over Na_2SO_4, and concentrated to give 27.1 g (100%) of **25** as a colorless oil.

3) To a solution of **25** (11.6 g, 39.3 mmol) in anhydrous THF (50 ml) at 0 °C is slowly added $BH_3{\cdot}S(CH_3)_2$ 2 N in THF (14 ml, 28 mmol) and the solution is stirred 2 days at RT. The final mixture is concentrated to ca. 50 ml and slowly poured into ice-cooled EtOH/THF 1:1 (50 ml). After 15 min. at 0 °C, 50 ml of a pH 7 buffer solution are added, followed slowly by 30% H_2O_2 aqueous solution (50 ml). The reaction mixture is stirred overnight at RT, diluted with 1 N NaOH and extracted with CH_2Cl_2. Combined organic layers are dried over Na_2SO_4, concentrated, then subjected to flash chromatography over silica gel (eluting with EtOAc/EtOH, 8:2) to yield 9.69 g (79%) of **26** as a colorless oil.

4) A solution of **26** (11.2 g, 35.8 mmol) and *N*-methylmorpholine *N*-oxide (4.67 g, 39.4 mmol) in anhydrous CH_2Cl_2 (100 ml) is stirred 1 h at RT, cooled to 0 °C, and TPAP (885 mg) is added portionwise. The reaction is allowed to warm to RT and stirred 1 h. Additional *N*-methyl-morpholine *N*-oxide (1.30 g, 11 mmol) and TPAP (300 mg) are then added to drive the reaction to completion after 1 h. The reaction mixture is filtered over Celite, concentrated, then subjected to flash chromatography over silica gel (eluting with CH_2Cl_2/acetone, 8:2 to 7:3) to provide 5.91 g (53%) of **27** as a yellow oil.

B) Preparation of title compounds of Example 6.

1) A solution of 1-bromo-4-(trifluoromethoxy)-benzene (4.20 ml, 28.0 mmol) in anhydrous THF (100 mL) is cooled to -78 °C and n-BuLi 2.5 N in hexanes (11.2 ml, 28.0 mmol) is added via syringe. The reaction mixture is allowed to warm to -50 °C for 10 min, cooled to -78 °C, and a solution of aldehyde **27** (6.20 g, 20.0 mmol) in anhydrous THF (15 ml) is added dropwise. After stirring 30 min at -78 °C, then 30 min at -20 °C, the solution is poured into half-brine and extracted with CH_2Cl_2 (3 x 100 ml). Combined organic layers are dried over Na_2SO_4, and concentrated to give 8.85 g (94%) of an alcohol as a yellow oil.

An additional 8.0 g of Dess-Martin periodinane is added and the reaction is stirred for an additional 4 h. The solution is poured into a 1:1 mixture of aqueous saturated $NaHCO_3$ and aqueous saturated $Na_2S_2O_3$ (200 ml), stirred 10 min, extracted with CH_2Cl_2, and dried over Na_2SO_4. The residue obtained after concentration of the solvents is purified by flash chromatography over silica gel (eluting with hexanes/EtOAc, 7:3) to yield 5.48 g (63%) of the ketone as a yellow oil.

After 2 min. at this temperature, dimethylsulfate (350 μl, 3.7 mmol) is slowly added and the solution is allowed to warm to RT and stirred 1 h. The mixture is poured into aqueous 0.1 N NaOH, extracted with CH_2Cl_2, and dried over Na_2SO_4. The residue obtained after concentration of the solvents is purified by flash chromatography over silica gel (eluting with hexanes/EtOAc, 75:25) to afford 0.55 g (62%) of the Z-methoxime as a slighly yellow oil.

1) The product of Example 6, step B-2 (566 mg, 1.20 mmol) is treated with H_3CONH_2·HCl using conditions similar to those shown in Example 6,

step B-3. The resulting crude mixture of Z- and E-methoximes is separated on a preparative silica gel TLC plate (eluting with hexanes/ EtOAc, 80:20) to afford, in order of elution, first the E-methoxime (175 mg; 29%), then the Z-methoxime (175 mg; 29%), both products as oils.

2) The Z-methoxime (75 mg; 0.15 mmol) of step 1 is deprotected following conditions similar to those shown in Example 6, step B-5 and the resulting free amine (46 mg) is directly subjected to amidation with 2,4-dimethylnicotinic acid using conditions similar to those shown in Example 6, step B-6 to yield 50 mg (82%) of a colorless oil.

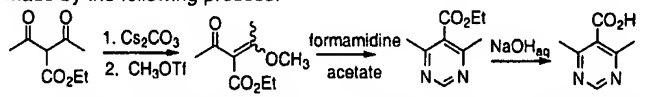
The 4,6-dimethylpyrimidine-5-carboxylic acid used in step 9 was made by the following process:



Step 1: Ethyl diacetoacetate (93.4 g), Cs_2CO_3 (185 g) and CH_3CN (550 ml) were mixed together, using an overhead mechanical stirrer. CH_3CN (50 ml) was added and the resulting mixture was cooled to 0°C. Methyl trifluoromethane sulfonate (88.6 g) was added dropwise and after addition, the cooling bath was removed. The mixture was stirred for 1 h at RT, filtered, and the salts were washed with Et_2O (2 X 50 ml). The organic extracts were combined and Et_2O (300 ml) was added. The resulting mixture was filtered, the filter cake was washed with Et_2O (2 X 100 ml), the Et_2O extracts were combined and evaporated to half volume. The solution was cooled in an ice bath and washed once with cooled (0°C) 2 N NaOH

(pH = 11). The Et_2O layer was dried over $MgSO_4$, filtered and evaporated to give the desired product as a yellow liquid (64.7 g) in 65% yield, which was used directly in the next step.

Step 2: The product of step 1 (64.2 g), sodium ethoxide in ethanol (commercial solution; 21 wt%; 113 g) and formamidine acetate (36.2 g) were mixed together at RT. After refluxing for 4 h, the mixture was cooled to RT, the resulting precipitate was filtered off and the ethanol was removed under vacuum. The resulting liquid was partitioned between water and CH_2Cl_2 and the aqueous layer was extracted with CH_2Cl_2 (3 x 150 ml). The CH_2Cl_2 extracts were dried over $MgSO_4$, filtered and evaporated to give a dark crude liquid (50.7 g) which was purified by silica gel chromatography (980 g; 4:1 hexanes:EtOAc as eluant). After evaporation of the appropriate fractions, the desired product (28.5 g) was isolated in 46% yield and used directly in the next step.

Step 3: The product of step 2 (28.1 g), NaOH (6.72 g), water (65 ml) and EtOH (130 ml) were mixed together at RT and heated at reflux for 1h. The resulting solution was cooled to RT and the volatile materials were removed in vacuo until a thick paste resulted. Water (20 ml) was added, the mixture was cooled to 0°C and conc. HCl (14.3 ml) was added dropwise with stirring. The resulting white precipitate was collected by filtration, washed with ice water (2 X 10 ml) and air dried with suction for 30 min. The resulting white solid was treated with toluene (2 x 20 ml), the solvent was removed in vacuo at 50°C and then dried under vacuum (1 mm Hg) for 18 h. The desired product (14.9 g) was isolated as a white solid in 63% yield, mp: 176-178°C. Elemental analysis of $C_7H_8N_2O_2$: calc'd C 55.26%, H 5.30%, N 18.41%; found: C 55.13%, H 5.44%, N 18.18%.

A second crop of product was isolated by evaporation of the aqueous filtrate (from above) to dryness and addition of water (20 ml). The resulting mixture was stirred at RT for 5 min, cooled in an ice bath and the precipitate formed was collected by filtration. The resulting solid was washed with ice water (2 X 5 ml) and dried as described above to give the product (4.68 g) as a cream colored solid to give a combined yield of 83%.

The following assays can be used to determine the CCR5 inhibitory and antagonistic activity of the compounds of the invention.

CCR5 Membrane Binding Assay:

A high throughput screen utilizing a CCR5 membrane binding assay identifies inhibitors of RANTES binding. This assay utilizes membranes prepared from NIH 3T3 cells expressing the human CCR5 chemokine receptor which have the ability to bind to RANTES, a natural ligand for the receptor. Using a 96-well plate format, membrane preparations are incubated with ^{125}I-RANTES in the presence or absence of compound for one hour. Compounds are serially diluted over a wide range of 0.001ug/ml to 1 ug/ml and tested in triplicates. Reaction cocktails are harvested through glass fiber filters, and washed thoroughly. Total counts for replicates are averaged and data reported as the concentration required to inhibit 50 percent of total ^{125}I-RANTES binding. Compounds with potent activity in the membrane binding assay are further characterized in seconday cell-based HIV-1 entry and replication assays.

HIV-1 Entry Assay:

Replication defective HIV-1 reporter virions are generated by cotransfection of a plasmid encoding the NL4-3 strain of HIV-1 (which has been modified by mutation of the envelope gene and introduction of a luciferase reporter plasmid) along with a plasmid encoding one of several HIV-1 envelope genes as described by Connor et al, Virology, 206 (1995), p. 935-944. Following transfection of the two plasmids by calcium phosphate precipitation, the viral supernatants are harvested on day 3 and a functional viral titer determined. These stocks are then used to infect U87 cells stably expressing CD4 and the chemokine receptor CCR5 which have been preincubated with or without test compound. Infections are carried out for 2 hours at 37 °C, the cells washed and media replaced with fresh media containing compound. The cells are incubated for 3 days, lysed and luciferase

activity determined. Results are reported as the concentration of compound required to inhibit 50% of the luciferase activity in the control cultures.

HIV-1 Replication Assay:

This assay uses primary peripheral blood mononuclear cells or the stable U87-CCR5 cell line to determine the effect of anti-CCR5 compounds to block infection of primary HIV-1 strains. The primary lymphocytes are purified from normal healthy donors and stimulated *in vitro* with PHA and IL-2 three days prior to infection. Using a 96-well plate format, cells are pretreated with drug for 1 hour at 37 °C and subsequently infected with an M-tropic HIV-1 isolates. Following infection, the cells are washed to remove residual inoculum and cultured in the presence of compound for 4 days. Culture supernatants are harvested and viral replication measured by determination of viral p24 antigen concentration.

Calcium Flux Assay:

Cells expressing the HIV coreceptor CCR5 are loaded with calcium sensitive dyes prior to addition of compound or the natural CCR5 ligand. Compounds with agonist properties will induce a calcium flux signal in the cell, while CCR5 antagonists are identified as compounds which do not induce signaling by themselves but are capable of blocking signaling by the natural ligand RANTES.

GTPγS Binding Assay (secondary membrane binding assay):

A GTPγS binding assay measures receptor activation by CCR5 ligands. This assay measures the binding of ^{35}S labeled-GTP to receptor coupled G-proteins that occurs as a result of receptor activation by an appropriate ligand. In this assay, the CCR5 ligand, RANTES, is incubated with membranes from CCR5 expressing cells and binding to the receptor activation (or binding) is determined by assaying for bound ^{35}S label. The assay quantitatively determines if compounds exhibit agonist characteristics by inducing activation of the receptor or alternatively antagonist properties by measuring inhibition of RANTES binding in a competitive or non-competitive fashion.

Chemotaxis Assay:

The chemotaxis assay is a functional assay which characterizes the agonist vs. antagonist properties of the test compounds. The assay measures the ability of a non-adherent murine cell line expressing human CCR5 (BaF-550) to migrate across a membrane in response to either test compounds or natural ligands (i.e., RANTES, MIP-1ß). Cells migrate across the permeable membrane towards compounds with agonist activity. Compounds that are antagonists not only fail to induce chemotaxis, but are

also capable of inhibiting cell migration in response to known CCR5 ligands.

The role of CC chemokine receptors such as CCR-5 receptors in inflammatory conditions has been reported in such publications as Immunology Letters, 57, (1997), 117-120 (arthritis); Clinical & Experimental Rheumatology, 17 (4) (1999), p. 419-425 (rheumatoid arthritis); Clinical & Experimental Immunology, 117 (2) (1999), p.237-243 (atopic dermatitis); International Journal of Immunopharmacology, 20 (11) (1998), p. 661-7 (psoriasis); Journal of Allergy & Clinical Immunology, 100 (6, Pt 2) (1997), p. S52-5 (asthma); and Journal of Immunology, 159 (6) (1997), p. 2962-72 (allergies).

In the assay to determine inhibition of RANTES binding, compounds of the invention range in activity from a Ki of 0.1 to 2000 nM, with preferred compounds having a range of activity from 0.1 to 1000 nM, more preferably 0.1 to 500 nM, and most preferably 0.1 to 100 nM. The results for preferred and representative compounds of formulas I and II in the test to determine inhibition of RANTES binding are given in the table below. In the table, "Ex. No." stands for "Example Number" and "nM" stands for "nanomolar."

For preparing pharmaceutical compositions from the CCR5 antagonist compounds described by this invention, inert, pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, dispersible granules, capsules, cachets and suppositories. The powders and tablets may be comprised of from about 5 to about 95 percent active ingredient. Suitable solid carriers are known in the art, e.g. magnesium carbonate, magnesium stearate, talc, sugar or lactose. Tablets, powders, cachets and capsules can be used as solid dosage forms suitable for oral administration. Examples of pharmaceutically acceptable carriers and methods of manufacture for various compositions may be found in A. Gennaro (ed.), Remington's Pharmaceutical Sciences, 18th Edition, (1990), Mack Publishing Co., Easton, Pennsylvania.

Liquid form preparations include solutions, suspensions and emulsions. As an example may be mentioned water or water-propylene glycol solutions for parenteral injection or addition of sweeteners and opacifiers for oral solutions, suspensions and emulsions. Liquid form preparations may also include solutions for intranasal administration.

Aerosol preparations suitable for inhalation may include solutions and solids in powder form, which may be in combination with a pharmaceutically acceptable carrier, such as an inert compressed gas, e.g. nitrogen.

Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for either oral or parenteral administration. Such liquid forms include solutions, suspensions and emulsions.

The compounds of the invention may also be deliverable transdermally. The transdermal compositions can take the form of creams, lotions, aerosols and/or emulsions and can be included in a transdermal patch of the matrix or reservoir type as are conventional in the art for this purpose.

Preferably the compound is administered orally.

Preferably, the pharmaceutical preparation is in a unit dosage form. In such form, the preparation is subdivided into suitably sized unit doses containing appropriate quantities of the active component, e.g., an effective amount to achieve the desired purpose.

The quantity of active compound in a unit dose of preparation may be varied or adjusted from about 10 mg to about 500 mg, preferably from about 25 mg to about 300 mg, more preferably from about 50 mg to about 250 mg, and most preferably from about 55 mg to about 200 mg, according to the particular application.

The actual dosage of CCR5 compound employed may be varied depending upon the requirements of the patient and the severity of the condition being treated. Determination of the proper dosage regimen for a particular situation is within the skill of the art. For convenience, the total daily dosage may be divided and administered in portions during the day as required.

The amount and frequency of administration of the CCR5 compounds of the invention and/or the pharmaceutically acceptable salts thereof will be regulated according to the judgment of the attending clinician considering such factors as age, condition and size of the patient as well as severity of the symptoms being treated. A typical recommended daily dosage regimen for oral administration can range from about 100 mg/day to about 300 mg/day, preferably 150 mg/day to 250 mg/day, more preferably about 200 mg/day, in two to four divided doses.

The doses and dosage regimens of the NRTIs, NNRTIs, PIs and other agents used in combination with the CCR5 antagonists will be determined by the attending clinician inview of the approved doses and dosage regimens in the package inserts or as set forth in the protocols, taking into consideration the age, sex and condition of the patient and the severity of the condition treated.

The goal of the HIV-1 therapy of the present invention is to reduce the HIV-1-RNA viral load below the detectable limit. The "detectable limit of HIV-1-RNA" in the context of the present invention means that there are fewer than about 200 to fewer than about 50 copies of HIV-1-RNA per ml of plasma of the patient as measured by quantitative, multi-cycle reverse transcriptase PCR methodology. HIV-1-RNA is preferably measured in the present invention by the methodology of Amplicor -1 Monitor 1.5 (available from Roche Diagnsotics) or of Nuclisens HIV-1 QT -1.

While the present invention has been described in conjunction with the specific embodiments set forth above, many alternatives, modifications and variations thereof will be apparent to those of ordinary skill in the art. All such alternatives, modifications and variations are intended to fall within the spirit and scope of the present invention.
